Homepage: http://masterq.metasepi-design.com/

Brief

I launched my career on developing embedded devices using Unix-like kernel at Ricoh Company, Ltd. The experience was not only for designing device drivers but also including debug of virtual memory. And I have experience in IoT platfom such like ARM Cortex-M MCU and RTOS. Also I learned application design using functional language such like Haskell, and published some research papers[1] about such languages.

Skill Set

Deep knowledge for Unix-like Kernel and User Space

I am an expert for Unix-like kernel such like Linux, because I provided technical support for NetBSD, which is a Unix-like OS similar to Linux, at Ricoh. My skill is not only for NetBSD but also Linux. In fact, a race condition bug in PowerPC Linux kernel was fixed by me in only five days at MIRACLE LINUX.

Wide experience in IoT platform

I have a wide experience in IoT platform such like FreeRTOS, ChibiOS/RT[2], ARM Cortex-M, ESP8266, AVR and MSP430. Also I launched a new IoT business using TWELITE wireless platform[3] at Centillion Japan.

Leadership

I was leading a technical team of twenty people to support the OS at Ricoh. And also I have experience in leading offshore team in china to maintain web application at Centillion Japan.

Research Security and Quality

A prototype of own Secure-OS similar to OP-TEE[4] was designed by me at SELTECH. It runs with the other RTOS on ARM Cortex-M MCU. Also I have a wealth of experience in strong static typing language such like Haskell and verification of C language such like VeriFast[5], which are useful to keep the quality of products.

Work Experience

July 2013 - Present: Self-employed Researcher at METASEPI DESIGN

- Research and develop Ajhc Haskell Compiler[6]

- Host meetup[7] for hands-on to verify embedded application on ARM Cortex-M using STM32[8] board and ST-LINK[9] debugger

- ATS language evangelist[10][11] for embedded devices

- Verification evangelist using VeriFast, which is a verifier C language programs annotated with preconditions and postconditions

- Translated VeriFast Tutorial into Japanese[12]

- Support to develop any embedded software

- Manage Metasepi Project[13] and develop the core technology

August 2014 - Present: Part-time Researcher at RIKEN Advanced Institute for Computational Science

- Research embedded functional programming running on ARM Cortex-M and AVR

- Verification for RTOS application such like ChibiOS/RT running on ARM Cortex-M

November 2016 - Present: (As side job) Expert Engineer at SELTECH CORPORATION

- Maintain a Hypervisor for embedded market

- Design and develop own Secure-OS for ARM platform

February 2016 - November 2016: (As side job) Software Engineer at Life Robotics Inc.

- Design GUI application running on Linux OS, using C++ and Qt[14]

- Design network protocol for Robotics application

March 2015 - February 2016: (As side job) System Enginner at Centillion Japan Co., Ltd.

- Technical support for stock chart application using JavaScript

- Maintain MySQL database servers

- Launch new IoT business for farming

- Design a platform[15] to accelerate R programs

[14] https://www.qt.io/
[15] https://github.com/centillion-tech/kick-r

September 2014 - December 2014: (As side job) Software engineer at Axsh co., LTD.

- Develop an OpenFlow application named "OpenVNet"[16]

- Design automation scripts for AWS using Ruby and GNU make

March 2012 - July 2013: Software Engineer at MIRACLE LINUX CORPORATION

- Maintain own Digital Signage platform running on Intel architecture using Linux OS, C++, OpenGL, GTK+[17] and GStreamer[18]

- Verify and tune up performance of Digital Signage on new Intel platform and Intel video driver

- Verify PowerPC Linux kernel and debug/fix a race condition in the SMP kernel

- Debug and fix bug of crash[19] command's PowerPC virtual memory paging

- Design new Windows installer using NSIS[20]

- Introduce and maintain new Git server for internal use

April 2001 - February 2012: Software Development Engineer at Ricoh Company, Ltd.

- Develop BIOS and bootloader for multifunction printer on Intel architecture

- Design secure boot for multifunction printer on Intel architecture

- Develop new BIOS for multifunction printer

- Tune multifunction printer boot time as 10 seconds

- Develop POSIX thread library

- Develop and technical support NetBSD OS

- Port OS to new Intel hardware

Education

- March 2001: Master of Engineering from Department of Electrical and Electronic Engineering, Tokyo Metropolitan University.
  The thesis: "Multimode Quartz Crystal Microbalance"[21]

Activities

Open-source projects

Metasepi Project[26]

- Challenge to create an open-source Unix-like operating system designed with strong type such as ML or Haskell.

- Rewriting NetBSD kernel using Ajhc Haskell compiler. `https://github.com/metasepi/netbsd-arafura-s1`

Ajhc Haskell compiler[27]

- Extend and add embedded features to Jhc Haskell Compiler `http://repetae.net/computer/jhc/`.

- Ajhc has thread-safe and reentrant runtime. Also has Erlang style GC. It means Ajhc's Haskell context has own GC heap. GC can run on tiny CPU such as Cortex-M3 with 32kB RAM.

Japan ATS User Group[28]

- An user group for ATS language promotion of utilization. Translating ATS documents into Japanese.

Debian Maintainer[29]

- Maintained uim package at Debian squeeze, and packages using Haskell at sid.

Carettah[30]

- A presentation tool written with Haskell. All of my slides[31] are created by the tool.
